

ICT Third-Party Monitoring Evidence Pack

Continuous monitoring evidence prepared to attach to a register of information maintained under Article 28(3) of Regulation (EU) 2022/2554.

Organisation	Meridian GRC

Chain verification at generation: **PASSED** — 4 records walked.

Integrity. All source observations in this document are held in an append-only, hash-chained store. The chain head hash printed on the cover page covers every observation recorded up to the generation time. Any subsequent alteration of a prior record changes that hash and is detectable by re-walking the chain. Retain this document to verify the store independently at a later date.

Machine-generated from public sources. Not a statement of fact. See 'Basis and limitations' before relying on any claim herein.

Fleet audit

Scores are relative to each vendor's own trailing baseline, not to one another. A vendor is flagged stale where no successful capture has completed in the last three days — staleness is reported because stale data is the condition this system exists to detect.

Vendor	Type	Score	Δ	Last capture	Alerts	Register
--------	------	-------	---	--------------	--------	----------

Verification

Two independent measures are reported. Citation resolution proves each numbered claim maps to a stored observation. Extraction fidelity proves the stored observation is supported by the source excerpt it was taken from. The second is the measure that catches extraction error; the first alone would certify a faithfully-cited but incorrectly-extracted claim.

Metric	Value	Basis
Citation resolution	not measured	0 distinct citations, 0 distinct claims, 0 unresolved
Extraction fidelity	not measured	0 sampled, 0 failed entailment

Evidence chain

Verification result	PASSED
Records walked	4
Head sequence	65
Head hash	39fe09448893d92a14df7961e55efbac9570e7904b8f80f3013713d832e6499e

Methodology

Six dimensions are scored against each vendor's own twelve-month trailing baseline. Volume-based dimensions are normalised into an anomaly ratio so that larger organisations, which naturally generate more coverage, are not penalised for their size. Dimension weights are context-conditioned: a dimension's weight depends on which other dimensions moved in the same window.

Weights are not calibrated. Scores in this document are PROVISIONAL and derived from provisional constants. No claim is made about their predictive validity.

Backtest result

Median lead time	None days
Events tested	1
Control vendors	1
Control false-positive rate	None

Backtest evidence is directional, not statistical. A small event set supports the claim that the score moved before observed deterioration; it does not support a precision claim.

Stated limitations

- Public-signal monitoring only. An organisation aware of being monitored can suppress some signals; weighting favours sources that are difficult to suppress, such as court dockets and regulatory filings.
- Private companies have no securities-filing coverage. The private-company source tier is materially thinner than public-company coverage.
- Scores are relative to each vendor's own history, not to peers.
- This document is monitoring evidence that attaches to a register of information. It is not itself a register of information.

Basis and limitations of this document

This document is generated automatically from publicly available sources. It is an intelligence product for internal risk-management use and is **not a statement of fact** about any named organisation, nor financial, legal or investment advice. **Confidence tiers.** Every factual claim carries a tier. *Verified* indicates a primary filing or two or more independent sources. *Reported* indicates a single credible source. *Unconfirmed* indicates weak or aggregator-only sourcing. Claims are not equally supported and should not be read as though they were.

Scope. This is continuous monitoring evidence intended to **attach to** a register of information maintained under Article 28(3) of Regulation (EU) 2022/2554 (DORA). It is not itself a register of information and does not satisfy that obligation on its own. **Method and its limits.** Scores measure deviation from each vendor's own trailing baseline, not comparison against peers. Coverage depends on public signal availability; private companies have materially thinner regulatory coverage than listed ones. An organisation aware of being monitored can suppress some public signals. No claim is made that this document predicts vendor failure. **Corrections.** Any claim can be disputed through the correction workflow. Disputed signals are superseded, not deleted, and the score is recomputed. Named organisations may request correction through the register owner. **Personal data.** Information about named individuals is limited to their professional role and dated events, processed on a legitimate-interest basis. Erasure requests are honoured by cryptographic key destruction; the underlying observation is retained without the identifier.
